

In the Abstract:

Please amend the Abstract as follows:

A method and a device such as a modern mobile terminal for addressing reachability information over a wireless communications network providing access to a number of data elements. First, criteria are obtained for finding information related to at least a single person or entity—(404), and then, a search is conducted in the wireless communications network or a connected network thereof in order to access data substantially fulfilling the criteria—(406). Next, at least part of the data found is associated with a context—(408), and finally the reachability information is established on the basis of the context—(410).
